Transcript: https://dontveter.com/ec/ufosonmoon.pdf

A group of astronomers say they've discovered giant UFOs flying around the moon.

And they're saying aliens could be here any minute now. Or as the Daily Mail put it, scientists issue warning after spotting more than 20 giant UFOs racing across the moon.

Don't worry, it's probably nothing. But I also have an interesting something for you to think about. Let's have a look.

The astronomers pointed a 15-centimetre telescope at the moon, corrected the images for camera noise, and found some moving spots which they refer to as unidentified flying objects.

They calculated that the UFOs are 20 to 40 km across, some are shaped like giant rings, and they travel at up to 11 km/s.

The authors think, quote, "UFOs demonstrate intelligent behavior", and "We believe that the moon serves as a base for UFOs".

They made their observations in September last year, so the aliens are taking their time.

The paper is not peer reviewed and comes from three researchers in Ukraine. Two of them already made headlines four years ago when they claimed they had observed extremely fast UFOs over Ukraine.

Their own institution subsequently published a report saying that the authors had an error in their data analysis. The distance to the objects was much less than they thought.

So the objects were much smaller and much slower. The new paper basically has the same problem.

Some of these "objects" that they observed are barely at pixel resolution of their camera. The authors themselves write that one object has a size of 2x2 pixels.

And with only one record, you have no way to determine the distance. They basically have no data. For all I can tell, they've observed dust.

This so called paper is so complete crap. They probably just wrote this to bait the Daily Mail. 2x2 pixels. Aliens are on the moon. It's exploded my [__] meter.

That said, people have been reporting strange lights and objects around the moon for a very long time.

Some of those reports came from the Apollo astronauts as you can read in the documents that the US government just put out in early August.

For example, during Apollo 12, astronaut Alan Bean was on the moon and said he could see particles of light, flashes of light sailing away into space.

He said, "It looks like some of those things are escaping the moon."

During Apollo 11, the astronaut saw some region near a crater light up.

During the Apollo 17 flyover, geologist Harrison Schmitt suddenly said, "Hey, I just saw a flash on the lunar surface."

There have been thousands of reports of reported moon irregularities. Some of those might be meteorite impacts or sunlight reflections, but some of them can't be explained that way.

For example, in 2007, an Italian amateur astronomer filmed a dark circular object apparently crossing the surface of the moon. In 2020, someone else near Montreal filmed three elongated objects.

In March 2024, a German astronomer filmed a fast dark object crossing the lunar disc that he could not identify. Yeah.

No, I don't think any of these were alien spacecraft, but I do think it's very possible that sometime in the past billion years or so, extra terrestrials came by our solar system and had a look at our planet.

And they'd most likely have done that from the moon. Maybe their technology is indeed still there.

And this isn't just something I made up. In 2013, two physicists argued in a peer-reviewed paper that we should search for alien artifacts on the moon.

Their reasoning was that the lunar surface changes incredibly slowly, which is both great for observations and great for preservation of whatever was doing the observation.

They estimate that an object a few tens of meters across could take hundreds of millions of years to disappear through impacts.

Concretely, they say we might find instrumentation deliberately installed to monitor Earth or a dominant probe awaiting contact.

This search still hasn't been done. You also don't have a database dedicated to moon anomalies. Anomalous moon observations are usually lumped together with general UAP sightings.

I think it would be a good idea to keep these separate because if you're looking to explain them, these explanations would have to be very different.

I mean, look, the European Union has a database for potato types. I feel like moon UFOs could get at least a spreadsheet.

In other news, a physicist just wrote a paper claiming that some of the observed unidentified anomalous phenomena are dark matter.

Chances are, if we ever find actual aliens, physicists will explain they're a previously unknown type of dark matter.

I used to receive a lot of spam calls after my cell phone number leaked, probably from some online shops that I used to use.

This is why I've signed up to Incogni who've been sponsoring this video and who've prevented this from happening again.

You see, the issue is that each time you open a website, it'll try to collect data about who you are and where you are and what other websites you've visited.

Many firms then make money by selling your private information to data brokers. Most countries have laws against that and you can ask for your data to be removed, but doing this takes up a lot of time.

Incogni automates the process of getting you out of those databases. You sign up and they will request that your personal details be removed. They'll keep on doing that and if you want send you regular updates.

They now also have a custom removal feature where you can submit specific websites.

I've been using this a lot. Incogni has really solved the problem for me. If that sounds like something you could need to use my code SABINE or the custom link in the info because the first 100 people to use it will get 60% off.

Stay safe. Thanks for watching. See you tomorrow.
